

PANGASINAN HERITAGE DIGITAL SHOWCASE

Activity 1.2 — Atomic Design System Manual

This manual documents the actual component library included in the source code. It follows Brad Frost's Atomic Design levels requested by the activity: Atoms, Molecules, and Organisms.

ATOMS: Button

Code reference: components/atoms/Button.jsx

Usage context: Reusable primary action button. Used for actions such as Search. Responsive by inheriting the layout of its parent; in the mobile search form it expands to full width.

Visual preview: The running project homepage renders this component in context. The ZIP includes the complete runnable source code; open the homepage after `npm run dev` to view the component.

ATOMS: Typography

Code reference: components/atoms/Typography.jsx

Usage context: A semantic text wrapper that accepts an HTML element through the `as` prop. Use it when pages need consistent, reusable text structure. Typography naturally wraps on smaller screens.

Visual preview: The running project homepage renders this component in context. The ZIP includes the complete runnable source code; open the homepage after `npm run dev` to view the component.

ATOMS: Color Tokens

Code reference: components/atoms/ColorTokens.js

Usage context: Central token object for primary, ink, surface, accent, and border colors. Use tokens when extending the design system so new components remain visually consistent.

Visual preview: The running project homepage renders this component in context. The ZIP includes the complete runnable source code; open the homepage after `npm run dev` to view the component.

ATOMS: Icon

Code reference: components/atoms/Icon.jsx

Usage context: Small accessible visual marker used inside Heritage Card. The label provides an accessible name. Its fixed 38px container remains usable across screen sizes.

Visual preview: The running project homepage renders this component in context. The ZIP includes the complete runnable source code; open the homepage after `npm run dev` to view the component.

ATOMS: Image

Code reference: components/atoms/Image.jsx

Usage context: Lazy-loaded responsive image atom. Use for destination photography when real image assets are available. It fills its container and uses object-fit cover.

Visual preview: The running project homepage renders this component in context. The ZIP includes the complete runnable source code; open the homepage after `npm run dev` to view the component.

MOLECULES: Heritage Card

Code reference: components/molecules/HeritageCard.jsx

Usage context: Used exclusively for displaying tourist-site previews in the responsive heritage-site grid. It stacks visual, location, title, and description content.

Visual preview: The running project homepage renders this component in context. The ZIP includes the complete runnable source code; open the homepage after `npm run dev` to view the component.

MOLECULES: Search Form

Code reference: components/molecules/SearchForm.jsx

Usage context: Used in the hero area to let visitors search heritage content. Desktop uses a horizontal field/button; below 800px it switches to a vertical layout.

Visual preview: The running project homepage renders this component in context. The ZIP includes the complete runnable source code; open the homepage after `npm run dev` to view the component.

MOLECULES: Navigation Item

Code reference: components/molecules/NavigationItem.jsx

Usage context: Reusable navigation link used by the header. Navigation links are hidden at the narrow mobile breakpoint to keep the header uncluttered.

Visual preview: The running project homepage renders this component in context. The ZIP includes the complete runnable source code; open the homepage after `npm run dev` to view the component.

ORGANISMS: Heritage Grid

Code reference: components/organisms/HeritageGrid.jsx

Usage context: Combines Heritage Cards into the main destination collection. It uses 1 column on mobile, 2 on tablet, and 3 on larger screens.

Visual preview: The running project homepage renders this component in context. The ZIP includes the complete runnable source code; open the homepage after `npm run dev` to view the component.

ORGANISMS: Header Navigation

Code reference: components/organisms/HeaderNavigation.jsx

Usage context: Combines the brand and Navigation Items into the page header. It remains sticky; desktop shows links while small screens simplify the navigation.

Visual preview: The running project homepage renders this component in context. The ZIP includes the complete runnable source code; open the homepage after `npm run dev` to view the component.

Responsive design rules

The main breakpoint is 800px: navigation simplifies, the hero padding reduces, the search form stacks, and the grid becomes one column. Between 801px and 1050px the grid uses two columns. Above 1050px it uses three columns. This mobile-first approach directly supports the activity requirement for different screen sizes.

Reuse example

A developer can import `HeritageCard` into another page and pass `name`, `location`, `description`, and `emoji` props. `HeritageGrid` demonstrates the same component being reused over an array of site data.

Accessibility notes

The implementation uses a `main` landmark, semantic `header`, `nav`, `section`, `article`, form/search semantics, a visible-to-screen-reader search label, and descriptive text. Interactive controls are native HTML controls so keyboard interaction is retained.
